

# Landmarks

Major geographic features of note.

- [The First Mountain](#)
- [The Inher River](#)
- [Cœur Lake](#)
- [The Sang River](#)
- [De Grote Vlakte \(The Great Plain\)](#)

# The First Mountain

The First Mountain is among the oldest and tallest mountains in The Table, located in the central-eastern portion of the main continent. It is located adjacent to the Source, the spring where the [Minnoar](#) first emerged, and has rivers connecting both to the east and west. It is also the location of the Elven capital of Eithel.

# The Inher River

Major dividing river creating a natural boundary between the Fleur and the Hongsu. The river is known for being very wide but not particularly fast or difficult to cross. It flows into a lake system to the East and flows into the major lake (?????) to the South.

There is a major crossing point between the two citadels of Sisteron and Hwando. A neutral city sits on the river between them offering a space of no government oversight.

# Cœur Lake

The largest lake on The Table. It connects to [The Inher River](#) from the North and feeds into the Sang River to the south.

There is an island in the middle of the lake that is a holy site for the [Fleurs \(Aasimar\)](#).

# The Sang River

This river runs out of [Cœur Lake](#) North before bending back to the West and emptying out into the Mer Noire (Black Sea). The river turns into a delta near the outlet into the sea helping form the incredibly fertile lands that help sustain the Fleur people. The river floods very predictably from year to year.

# De Grote Vlakte (The Great Plain)

The name for the large expanse of grassland on the far Western portion of the Table. Homeland of the Thate people. The area is known for having hot summers and mild winters. The ecology of the area is similar to that of the American Midwest and animals such as typical grassland and plains vegetation and animals can be found here. The ground is conducive to farming but very little of it is touched by the Thate for that purpose.

Tornadoes are a somewhat common occurrence in this area but the Thate are able to predict the storms with some accuracy to avoid them altogether.
